

AZ-900 Original Practice Question Set

100 exam-style questions with explanations and distractor analysis

Total questions	100
Mix	Easy, medium, and tricky questions; direct recall and scenario-based items
Organization	Domain 1, Domain 2, Domain 3, then a mixed final mini-mock
Method	Original questions based on official Microsoft objective scope and current documentation

How this guide was built

These practice questions are original. They are intentionally modeled on AZ-900 patterns and confusion points, but they are not copied from unauthorized dumps, leaks, or memorized live exam banks.

Use this guide in three passes: (1) read the cheat sheet, (2) work the domain guide with the comparison tables, and (3) finish with the 100 original practice questions and the mixed mini-mock.

Contents

- Domain 1 questions (1–25)
- Domain 2 questions (26–65)
- Domain 3 questions (66–90)
- Mixed final mini-mock (91–100)

Domain 1 — Cloud concepts

Focus here on cloud vocabulary, pricing model logic, and service-model distinctions.

Question 1

Domain 1 — Cloud concepts | Objective 1.01 | Easy | Multiple Choice

Which statement best defines cloud computing?

- A. Renting computing capability over a network on demand
- B. Buying datacenter hardware for future growth
- C. Running only virtual machines on-premises
- D. Installing software on local desktops

Answer: A. Renting computing capability over a network on demand

This is correct because Renting computing capability over a network on demand is the best match for the scenario or definition being tested. In this objective, the key idea is In Azure, that means you consume Microsoft-hosted compute, storage, networking, identity, and higher-level services on demand. That aligns with objective 1.01 (Define cloud computing) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Buying datacenter hardware for future growth: This option does not best match the definition or requirement in the question. The strongest answer is Renting computing capability over a network on demand.

C. Running only virtual machines on-premises: This option does not best match the definition or requirement in the question. The strongest answer is Renting computing capability over a network on demand.

D. Installing software on local desktops: This option does not best match the definition or requirement in the question. The strongest answer is Renting computing capability over a network on demand.

Question 2

Domain 1 — Cloud concepts | Objective 1.02 | Easy | Multiple Choice

In the shared responsibility model for an Azure virtual machine, who is mainly responsible for patching the guest operating system?

- A. Microsoft
- B. The customer
- C. The internet service provider
- D. The hardware manufacturer

Answer: B. The customer

This is correct because The customer is the best match for the scenario or definition being tested. In this objective, the key idea is Microsoft always manages the physical datacenters; you still manage what you put into your tenant and how you configure many services. That aligns with objective 1.02 (Describe the shared responsibility model) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Microsoft: This option does not best match the definition or requirement in the question. The strongest answer is The customer.

C. The internet service provider: This option does not best match the definition or requirement in the question. The strongest answer is The customer.

D. The hardware manufacturer: This option does not best match the definition or requirement in the question. The strongest answer is The customer.

Question 3

Domain 1 — Cloud concepts | Objective 1.03 | Easy | Scenario

A company wants to run new applications entirely in Microsoft-managed datacenters without owning physical infrastructure. Which cloud model best fits?

- A. Private cloud
- B. Hybrid cloud
- C. Public cloud
- D. Colocation only

Answer: C. Public cloud

This is correct because Public cloud is the best match for the scenario or definition being tested. In this objective, the key idea is Microsoft-operated shared cloud infrastructure used by many customers with logical isolation. That aligns with objective 1.03 (Define cloud models: public, private, and hybrid) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Private cloud: This is wrong because Private cloud refers to cloud environment dedicated to one organization., whereas the best answer is Public cloud for the requirement described.

B. Hybrid cloud: This is wrong because Hybrid cloud refers to integrated use of public cloud with private or on-premises resources., whereas the best answer is Public cloud for the requirement described.

D. Colocation only: This option does not best match the definition or requirement in the question. The strongest answer is Public cloud.

Question 4

Domain 1 — Cloud concepts | Objective 1.03 | Medium | Scenario

An organization must keep a manufacturing control system on-premises but wants to connect it to Azure analytics services. Which cloud model is the best answer?

- A. Public cloud
- B. Hybrid cloud
- C. Private cloud
- D. SaaS

Answer: B. Hybrid cloud

This is correct because Hybrid cloud is the best match for the scenario or definition being tested. In this objective, the key idea is integrated use of public cloud with private or on-premises resources. That aligns with objective 1.03 (Define cloud models: public, private, and hybrid) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Public cloud: This is wrong because Public cloud refers to Microsoft-operated shared cloud infrastructure used by many customers with logical isolation., whereas the best answer is Hybrid cloud for the requirement described.

C. Private cloud: This is wrong because Private cloud refers to cloud environment dedicated to one organization., whereas the best answer is Hybrid cloud for the requirement described.

D. SaaS: This is wrong because SaaS refers to software as a service delivered as a complete application., whereas the best answer is Hybrid cloud for the requirement described.

Question 5

Domain 1 — Cloud concepts | Objective 1.04 | Medium | Scenario

Which use case most strongly points to a private cloud?

- A. A startup wants to launch quickly with no owned hardware
- B. A business needs a cloud environment dedicated to a single organization
- C. A team wants to run serverless code
- D. A company needs short-term burst capacity only

Answer: B. A business needs a cloud environment dedicated to a single organization

This is correct because A business needs a cloud environment dedicated to a single organization is the best match for the scenario or definition being tested. In this objective, the key idea is Azure public cloud is strong for new apps and burst capacity; private cloud helps when dedicated control is required; hybrid helps when integration with existing systems matters. That aligns with objective 1.04 (Identify appropriate use cases for each cloud model) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. A startup wants to launch quickly with no owned hardware: This option does not best match the definition or requirement in the question. The strongest answer is A business needs a cloud environment dedicated to a single organization.

C. A team wants to run serverless code: This option does not best match the definition or requirement in the question. The strongest answer is A business needs a cloud environment dedicated to a single organization.

D. A company needs short-term burst capacity only: This option does not best match the definition or requirement in the question. The strongest answer is A business needs a cloud environment dedicated to a single organization.

Question 6

Domain 1 — Cloud concepts | Objective 1.05 | Easy | Multiple Choice

What is the main idea behind the consumption-based model?

- A. You always prepay for three years
- B. You pay according to measured usage
- C. You pay only for storage, not compute
- D. You can use Azure only during business hours

Answer: B. You pay according to measured usage

This is correct because You pay according to measured usage is the best match for the scenario or definition being tested. In this objective, the key idea is Azure billing is generally tied to measured usage such as compute time, storage consumed, data transfer, or transactions. That aligns with objective 1.05 (Describe the consumption-based model) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. You always prepay for three years: This option does not best match the definition or requirement in the question. The strongest answer is You pay according to measured usage.

C. You pay only for storage, not compute: This option does not best match the definition or requirement in the question. The strongest answer is You pay according to measured usage.

D. You can use Azure only during business hours: This option does not best match the definition or requirement in the question. The strongest answer is You pay according to measured usage.

Question 7

Domain 1 — Cloud concepts | Objective 1.06 | Medium | Scenario

A workload is stable and expected to run continuously for a long time. Which pricing approach is typically more cost-efficient than pay-as-you-go?

- A. Reservation
- B. Spot pricing
- C. Archive tier
- D. Cold tier

Answer: A. Reservation

This is correct because Reservation is the best match for the scenario or definition being tested. In this objective, the key idea is commitment-based pricing that can reduce cost for stable long-running workloads. That aligns with objective 1.06 (Compare cloud pricing models) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Spot pricing: This is wrong because Spot pricing refers to discounted pricing for interruptible spare capacity., whereas the best answer is Reservation for the requirement described.

C. Archive tier: This is wrong because Archive tier refers to offline Blob tier for rarely accessed data with slower retrieval., whereas the best answer is Reservation for the requirement described.

D. Cold tier: This is wrong because Cold tier refers to Blob tier for rarely accessed online data., whereas the best answer is Reservation for the requirement described.

Question 8

Domain 1 — Cloud concepts | Objective 1.07 | Easy | Multiple Choice

Which Azure compute option is the clearest example of serverless on AZ-900?

- A. Azure Virtual Machines
- B. Azure Functions
- C. Azure Storage Explorer
- D. Azure VPN Gateway

Answer: B. Azure Functions

This is correct because Azure Functions is the best match for the scenario or definition being tested. In this objective, the key idea is serverless event-driven compute service. That aligns with objective 1.07 (Describe serverless) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Azure Virtual Machines: This option does not best match the definition or requirement in the question. The strongest answer is Azure Functions.

C. Azure Storage Explorer: This is wrong because Azure Storage Explorer refers to GUI tool for browsing and managing Azure Storage., whereas the best answer is Azure Functions for the requirement described.

D. Azure VPN Gateway: This option does not best match the definition or requirement in the question. The strongest answer is Azure Functions.

Question 9

Domain 1 — Cloud concepts | Objective 1.08 | Easy | Multiple Choice

Which term is most directly about keeping a service running despite component failure?

- A. Scalability
- B. High availability
- C. Predictability
- D. Elasticity

Answer: B. High availability

This is correct because High availability is the best match for the scenario or definition being tested. In this objective, the key idea is keeping a service accessible despite component failure. That aligns with objective 1.08 (Describe the benefits of high availability and scalability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Scalability:** This is wrong because Scalability refers to ability to handle increased demand by adding capacity., whereas the best answer is High availability for the requirement described.
- C. Predictability:** This is wrong because Predictability refers to expected and consistent performance or cost behavior., whereas the best answer is High availability for the requirement described.
- D. Elasticity:** This is wrong because Elasticity refers to ability to scale out and back automatically as demand changes., whereas the best answer is High availability for the requirement described.

Question 10

Domain 1 — Cloud concepts | Objective 1.08 | Medium | Scenario

A web application should continue running even if one hosting component fails. Which concept is the best match?

- A. High availability
- B. Capital expenditure
- C. Hybrid cloud
- D. Archive storage

Answer: A. High availability

This is correct because High availability is the best match for the scenario or definition being tested. In this objective, the key idea is keeping a service accessible despite component failure. That aligns with objective 1.08 (Describe the benefits of high availability and scalability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Capital expenditure:** This option does not best match the definition or requirement in the question. The strongest answer is High availability.
- C. Hybrid cloud:** This is wrong because Hybrid cloud refers to integrated use of public cloud with private or on-premises resources., whereas the best answer is High availability for the requirement described.

D. Archive storage: This option does not best match the definition or requirement in the question. The strongest answer is High availability.

Question 11

Domain 1 — Cloud concepts | Objective 1.08 | Easy | Multiple Choice

Which term is most directly about handling more workload by adding capacity?

- A. Scalability
- B. Reliability
- C. Governance
- D. Region pair

Answer: A. Scalability

This is correct because Scalability is the best match for the scenario or definition being tested. In this objective, the key idea is ability to handle increased demand by adding capacity. That aligns with objective 1.08 (Describe the benefits of high availability and scalability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Reliability: This is wrong because Reliability refers to consistent dependable operation over time., whereas the best answer is Scalability for the requirement described.

C. Governance: This option does not best match the definition or requirement in the question. The strongest answer is Scalability.

D. Region pair: This is wrong because Region pair refers to Microsoft-defined pairing of some Azure regions for certain resiliency scenarios., whereas the best answer is Scalability for the requirement described.

Question 12

Domain 1 — Cloud concepts | Objective 1.08 | Medium | Multiple Choice

Which term describes automatically scaling up when demand spikes and scaling back down when demand drops?

- A. Predictability
- B. Elasticity
- C. Reliability
- D. Availability

Answer: B. Elasticity

This is correct because Elasticity is the best match for the scenario or definition being tested. In this objective, the key idea is ability to scale out and back automatically as demand changes. That aligns with objective 1.08 (Describe the benefits of high availability and scalability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Predictability: This is wrong because Predictability refers to expected and consistent performance or cost behavior., whereas the best answer is Elasticity for the requirement described.

C. Reliability: This is wrong because Reliability refers to consistent dependable operation over time., whereas the best answer is Elasticity for the requirement described.

D. Availability: This option does not best match the definition or requirement in the question. The strongest answer is Elasticity.

Question 13

Domain 1 — Cloud concepts | Objective 1.09 | Easy | Multiple Choice

Which concept is best described as consistent, dependable operation over time?

- A. Reliability
- B. Scalability
- C. Reservation
- D. CapEx

Answer: A. Reliability

This is correct because Reliability is the best match for the scenario or definition being tested. In this objective, the key idea is consistent dependable operation over time. That aligns with objective 1.09 (Describe the benefits of reliability and predictability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Scalability: This is wrong because Scalability refers to ability to handle increased demand by adding capacity., whereas the best answer is Reliability for the requirement described.

C. Reservation: This is wrong because Reservation refers to commitment-based pricing that can reduce cost for stable long-running workloads., whereas the best answer is Reliability for the requirement described.

D. CapEx: This option does not best match the definition or requirement in the question. The strongest answer is Reliability.

Question 14

Domain 1 — Cloud concepts | Objective 1.09 | Medium | Multiple Choice

Which concept is mainly about expected and consistent performance or cost behavior?

- A. Predictability
- B. Elasticity
- C. Hybrid cloud
- D. Region pair

Answer: A. Predictability

This is correct because Predictability is the best match for the scenario or definition being tested. In this objective, the key idea is expected and consistent performance or cost behavior. That aligns with objective 1.09 (Describe the benefits of reliability and predictability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Elasticity: This is wrong because Elasticity refers to ability to scale out and back automatically as demand changes., whereas the best answer is Predictability for the requirement described.

C. Hybrid cloud: This is wrong because Hybrid cloud refers to integrated use of public cloud with private or on-premises resources., whereas the best answer is Predictability for the requirement described.

D. Region pair: This is wrong because Region pair refers to Microsoft-defined pairing of some Azure regions for certain resiliency scenarios., whereas the best answer is Predictability for the requirement described.

Question 15

Domain 1 — Cloud concepts | Objective 1.10 | Medium | Scenario

Which cloud benefit is most closely tied to centrally applied standards, policy, and organizational control?

- A. Governance benefit
- B. Scalability benefit
- C. Elasticity benefit
- D. Cold-tier benefit

Answer: A. Governance benefit

This is correct because Governance benefit is the best match for the scenario or definition being tested. In this objective, the key idea is Azure provides built-in identity, policy, encryption, logging, and compliance features that help enforce organizational standards at scale. That aligns with objective 1.10 (Describe the benefits of security and governance in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Scalability benefit: This option does not best match the definition or requirement in the question. The strongest answer is Governance benefit.

C. Elasticity benefit: This option does not best match the definition or requirement in the question. The strongest answer is Governance benefit.

D. Cold-tier benefit: This option does not best match the definition or requirement in the question. The strongest answer is Governance benefit.

Question 16

Domain 1 — Cloud concepts | Objective 1.10 | Easy | Multiple Choice

Which cloud benefit is most directly associated with provider investment in physical security and broad security tooling?

- A. Security benefit
- B. Archive benefit
- C. CapEx benefit
- D. Peering benefit

Answer: A. Security benefit

This is correct because Security benefit is the best match for the scenario or definition being tested. In this objective, the key idea is Azure provides built-in identity, policy, encryption, logging, and compliance features that help enforce organizational standards at scale. That aligns with objective 1.10 (Describe the benefits of security and governance in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Archive benefit: This option does not best match the definition or requirement in the question. The strongest answer is Security benefit.

C. CapEx benefit: This option does not best match the definition or requirement in the question. The strongest answer is Security benefit.

D. Peering benefit: This option does not best match the definition or requirement in the question. The strongest answer is Security benefit.

Question 17

Domain 1 — Cloud concepts | Objective 1.11 | Medium | Multiple Choice

What is a manageability benefit of cloud computing?

- A. You must manually rack hardware before deployment
- B. You can manage resources through portals, automation, and APIs
- C. You lose the ability to monitor workloads
- D. You can only manage services from one office

Answer: B. You can manage resources through portals, automation, and APIs

This is correct because You can manage resources through portals, automation, and APIs is the best match for the scenario or definition being tested. In this objective, the key idea is Azure centralizes management through tools like the portal, ARM, Azure Monitor, tags, and policy-driven governance. That aligns with objective 1.11 (Describe the benefits of manageability in the cloud) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. You must manually rack hardware before deployment: This option does not best match the definition or requirement in the question. The strongest answer is You can manage resources through portals, automation, and APIs.

C. You lose the ability to monitor workloads: This option does not best match the definition or requirement in the question. The strongest answer is You can manage resources through portals, automation, and APIs.

D. You can only manage services from one office: This option does not best match the definition or requirement in the question. The strongest answer is You can manage resources through portals, automation, and APIs.

Question 18

Domain 1 — Cloud concepts | Objective 1.12 | Easy | Multiple Choice

Which service model usually gives you the most control over the operating system?

- A. SaaS
- B. PaaS
- C. IaaS
- D. Serverless

Answer: C. IaaS

This is correct because IaaS is the best match for the scenario or definition being tested. In this objective, the key idea is infrastructure as a service; you manage more of the OS and application stack. That aligns with objective 1.12 (Describe infrastructure as a service (IaaS)) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. SaaS: This is wrong because SaaS refers to software as a service delivered as a complete application., whereas the best answer is IaaS for the requirement described.

B. PaaS: This is wrong because PaaS refers to platform as a service; you deploy code or data platforms without managing most OS plumbing., whereas the best answer is IaaS for the requirement described.

D. Serverless: This is wrong because Serverless refers to cloud execution model where you focus on code or workflow and the platform manages the servers., whereas the best answer is IaaS for the requirement described.

Question 19

Domain 1 — Cloud concepts | Objective 1.13 | Easy | Multiple Choice

Which service model is best described as deploying code to a managed platform without managing most OS plumbing?

- A. PaaS
- B. IaaS
- C. Private cloud
- D. CapEx

Answer: A. PaaS

This is correct because PaaS is the best match for the scenario or definition being tested. In this objective, the key idea is platform as a service; you deploy code or data platforms without managing most OS plumbing. That aligns with objective 1.13 (Describe platform as a service (PaaS)) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. IaaS: This is wrong because IaaS refers to infrastructure as a service; you manage more of the OS and application stack., whereas the best answer is PaaS for the requirement described.

C. Private cloud: This is wrong because Private cloud refers to cloud environment dedicated to one organization., whereas the best answer is PaaS for the requirement described.

D. CapEx: This option does not best match the definition or requirement in the question. The strongest answer is PaaS.

Question 20

Domain 1 — Cloud concepts | Objective 1.14 | Easy | Multiple Choice

Which service model is a complete software application delivered to end users?

- A. IaaS
- B. PaaS
- C. SaaS
- D. Hybrid cloud

Answer: C. SaaS

This is correct because SaaS is the best match for the scenario or definition being tested. In this objective, the key idea is software as a service delivered as a complete application. That aligns with objective 1.14 (Describe software as a service (SaaS)) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. IaaS: This is wrong because IaaS refers to infrastructure as a service; you manage more of the OS and application stack., whereas the best answer is SaaS for the requirement described.

B. PaaS: This is wrong because PaaS refers to platform as a service; you deploy code or data platforms without managing most OS plumbing., whereas the best answer is SaaS for the requirement described.

D. Hybrid cloud: This is wrong because Hybrid cloud refers to integrated use of public cloud with private or on-premises resources., whereas the best answer is SaaS for the requirement described.

Question 21

Domain 1 — Cloud concepts | Objective 1.15 | Medium | Scenario

A company wants the simplest option for employee email and collaboration software. Which service model is the best fit?

- A. IaaS
- B. PaaS
- C. SaaS
- D. Private cloud

Answer: C. SaaS

This is correct because SaaS is the best match for the scenario or definition being tested. In this objective, the key idea is software as a service delivered as a complete application. That aligns with objective 1.15 (Identify appropriate use cases for IaaS, PaaS, and SaaS) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. IaaS:** This is wrong because IaaS refers to infrastructure as a service; you manage more of the OS and application stack., whereas the best answer is SaaS for the requirement described.
- B. PaaS:** This is wrong because PaaS refers to platform as a service; you deploy code or data platforms without managing most OS plumbing., whereas the best answer is SaaS for the requirement described.
- D. Private cloud:** This is wrong because Private cloud refers to cloud environment dedicated to one organization., whereas the best answer is SaaS for the requirement described.

Question 22

Domain 1 — Cloud concepts | Objective 1.15 | Medium | Scenario

A developer needs to deploy a custom web app quickly but does not want to patch the operating system. Which service model is the best fit?

- A. IaaS
- B. PaaS
- C. SaaS
- D. Archive Storage

Answer: B. PaaS

This is correct because PaaS is the best match for the scenario or definition being tested. In this objective, the key idea is platform as a service; you deploy code or data platforms without managing most OS plumbing. That aligns with objective 1.15 (Identify appropriate use cases for IaaS, PaaS, and SaaS) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. IaaS:** This is wrong because IaaS refers to infrastructure as a service; you manage more of the OS and application stack., whereas the best answer is PaaS for the requirement described.
- C. SaaS:** This is wrong because SaaS refers to software as a service delivered as a complete application., whereas the best answer is PaaS for the requirement described.
- D. Archive Storage:** This option does not best match the definition or requirement in the question. The strongest answer is PaaS.

Question 23

Domain 1 — Cloud concepts | Objective 1.15 | Tricky | Scenario

An administrator must install a custom security agent inside the guest OS of several servers. Which service model is the clearest fit?

- A. SaaS
- B. PaaS
- C. IaaS
- D. Serverless

Answer: C. IaaS

This is correct because IaaS is the best match for the scenario or definition being tested. In this objective, the key idea is infrastructure as a service; you manage more of the OS and application stack. That aligns with objective 1.15 (Identify appropriate use cases for IaaS, PaaS, and SaaS) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. SaaS:** This is wrong because SaaS refers to software as a service delivered as a complete application., whereas the best answer is IaaS for the requirement described.
- B. PaaS:** This is wrong because PaaS refers to platform as a service; you deploy code or data platforms without managing most OS plumbing., whereas the best answer is IaaS for the requirement described.
- D. Serverless:** This is wrong because Serverless refers to cloud execution model where you focus on code or workflow and the platform manages the servers., whereas the best answer is IaaS for the requirement described.

Question 24

Domain 1 — Cloud concepts | Objective 1.06 | Medium | Multiple Choice

Which financial change is most associated with cloud adoption?

- A. More spending shifts toward operating expenditure (OpEx)
- B. All spending becomes capital expenditure (CapEx)
- C. There is never any ongoing cost
- D. Cloud removes all licensing considerations

Answer: A. More spending shifts toward operating expenditure (OpEx)

This is correct because More spending shifts toward operating expenditure (OpEx) is the best match for the scenario or definition being tested. In this objective, the key idea is For AZ-900, the core comparison is pay-as-you-go versus options that trade flexibility for lower cost, such as reservations or savings mechanisms. That aligns with objective 1.06 (Compare cloud pricing models) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. All spending becomes capital expenditure (CapEx):** This option does not best match the definition or requirement in the question. The strongest answer is More spending shifts toward operating expenditure (OpEx).
- C. There is never any ongoing cost:** This option does not best match the definition or requirement in the question. The strongest answer is More spending shifts toward operating expenditure (OpEx).
- D. Cloud removes all licensing considerations:** This option does not best match the definition or requirement in the question. The strongest answer is More spending shifts toward operating expenditure (OpEx).

Question 25

Domain 1 — Cloud concepts | Objective 1.02 | Tricky | Scenario

A question asks who secures the physical datacenter in Azure, regardless of whether the service is IaaS, PaaS, or SaaS. What is the best answer?

- A. The customer
- B. Microsoft
- C. A third-party MSP
- D. The subscription owner only

Answer: B. Microsoft

This is correct because Microsoft is the best match for the scenario or definition being tested. In this objective, the key idea is Microsoft always manages the physical datacenters; you still manage what you put into your tenant and how you configure many services. That aligns with objective 1.02 (Describe the shared responsibility model) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. The customer: This option does not best match the definition or requirement in the question. The strongest answer is Microsoft.

C. A third-party MSP: This option does not best match the definition or requirement in the question. The strongest answer is Microsoft.

D. The subscription owner only: This option does not best match the definition or requirement in the question. The strongest answer is Microsoft.

Domain 2 — Azure architecture and services

Focus here on Azure architecture, compute, networking, storage, identity, access, and security.

Question 26

Domain 2 — Azure architecture and services | Objective 2.01 | Easy | Multiple Choice

What is an Azure region?

- A. A physical rack inside one datacenter
- B. A deployment geography containing one or more datacenters
- C. A pricing discount model
- D. A guest operating system feature

Answer: B. A deployment geography containing one or more datacenters

This is correct because A deployment geography containing one or more datacenters is the best match for the scenario or definition being tested. In this objective, the key idea is Azure regions are where you place resources. Some regions are paired, while many newer regions are nonpaired and rely heavily on availability zones. Sovereign clouds work like Azure but can have different service availability and boundaries. That aligns with objective 2.01 (Describe Azure regions, region pairs, and sovereign regions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. A physical rack inside one datacenter: This option does not best match the definition or requirement in the question. The strongest answer is A deployment geography containing one or more datacenters.

C. A pricing discount model: This option does not best match the definition or requirement in the question. The strongest answer is A deployment geography containing one or more datacenters.

D. A guest operating system feature: This option does not best match the definition or requirement in the question. The strongest answer is A deployment geography containing one or more datacenters.

Question 27

Domain 2 — Azure architecture and services | Objective 2.01 | Medium | Multiple Choice

What is the main idea of an Azure region pair?

- A. Two availability zones inside one region
- B. A Microsoft-defined pairing of some regions for resiliency scenarios
- C. Two resource groups connected by policy
- D. A storage account with two tiers

Answer: B. A Microsoft-defined pairing of some regions for resiliency scenarios

This is correct because A Microsoft-defined pairing of some regions for resiliency scenarios is the best match for the scenario or definition being tested. In this objective, the key idea is Azure regions are where you place resources. Some regions are paired, while many newer regions are nonpaired and rely heavily on availability zones. Sovereign clouds work like Azure but can have different service availability and boundaries. That aligns with objective 2.01 (Describe Azure regions, region pairs, and sovereign regions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Two availability zones inside one region:** This option does not best match the definition or requirement in the question. The strongest answer is A Microsoft-defined pairing of some regions for resiliency scenarios.
- C. Two resource groups connected by policy:** This option does not best match the definition or requirement in the question. The strongest answer is A Microsoft-defined pairing of some regions for resiliency scenarios.
- D. A storage account with two tiers:** This option does not best match the definition or requirement in the question. The strongest answer is A Microsoft-defined pairing of some regions for resiliency scenarios.

Question 28

Domain 2 — Azure architecture and services | Objective 2.01 | Medium | Multiple Choice

Which choice best describes a sovereign region?

- A. A region built for special sovereignty or regulatory requirements
- B. A region used only for backups
- C. A VM-only region
- D. A private peering feature

Answer: A. A region built for special sovereignty or regulatory requirements

This is correct because A region built for special sovereignty or regulatory requirements is the best match for the scenario or definition being tested. In this objective, the key idea is Azure regions are where you place resources. Some regions are paired, while many newer regions are nonpaired and rely heavily on availability zones. Sovereign clouds work like Azure but can have different service availability and boundaries. That aligns with objective 2.01 (Describe Azure regions, region pairs, and sovereign regions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. A region used only for backups:** This option does not best match the definition or requirement in the question. The strongest answer is A region built for special sovereignty or regulatory requirements.
- C. A VM-only region:** This option does not best match the definition or requirement in the question. The strongest answer is A region built for special sovereignty or regulatory requirements.
- D. A private peering feature:** This option does not best match the definition or requirement in the question. The strongest answer is A region built for special sovereignty or regulatory requirements.

Question 29

Domain 2 — Azure architecture and services | Objective 2.02 | Easy | Multiple Choice

What is an availability zone?

- A. A billing scope for multiple subscriptions
- B. A physically separate location inside a region
- C. A DNS zone file only
- D. A storage redundancy meter

Answer: B. A physically separate location inside a region

This is correct because A physically separate location inside a region is the best match for the scenario or definition being tested. In this objective, the key idea is Many Azure regions support zones so you can design for datacenter-level fault isolation inside one region. That aligns with objective 2.02 (Describe availability zones) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. A billing scope for multiple subscriptions:** This option does not best match the definition or requirement in the question. The strongest answer is A physically separate location inside a region.
- C. A DNS zone file only:** This option does not best match the definition or requirement in the question. The strongest answer is A physically separate location inside a region.
- D. A storage redundancy meter:** This option does not best match the definition or requirement in the question. The strongest answer is A physically separate location inside a region.

Question 30

Domain 2 — Azure architecture and services | Objective 2.03 | Easy | Multiple Choice

Which term means the physical facility that hosts Azure infrastructure?

- A. Datacenter
- B. Resource group
- C. Subscription
- D. Subnet

Answer: A. Datacenter

This is correct because Datacenter is the best match for the scenario or definition being tested. In this objective, the key idea is physical facility hosting Azure infrastructure. That aligns with objective 2.03 (Describe Azure datacenters) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Resource group:** This is wrong because Resource group refers to logical container for related Azure resources., whereas the best answer is Datacenter for the requirement described.
- C. Subscription:** This is wrong because Subscription refers to billing and administrative boundary for Azure resources., whereas the best answer is Datacenter for the requirement described.

D. Subnet: This is wrong because Subnet refers to logical IP segment inside a VNet., whereas the best answer is Datacenter for the requirement described.

Question 31

Domain 2 — Azure architecture and services | Objective 2.04 | Easy | Multiple Choice

What is a resource group used for?

- A. It stores only virtual networks
- B. It is a logical container for related Azure resources
- C. It is the same thing as a subscription
- D. It is a physical datacenter

Answer: B. It is a logical container for related Azure resources

This is correct because It is a logical container for related Azure resources is the best match for the scenario or definition being tested. In this objective, the key idea is Azure Resource Manager organizes resources into resource groups so you can deploy, manage, monitor, and remove related resources together. That aligns with objective 2.04 (Describe Azure resources and resource groups) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. It stores only virtual networks:** This option does not best match the definition or requirement in the question. The strongest answer is It is a logical container for related Azure resources.
- C. It is the same thing as a subscription:** This option does not best match the definition or requirement in the question. The strongest answer is It is a logical container for related Azure resources.
- D. It is a physical datacenter:** This option does not best match the definition or requirement in the question. The strongest answer is It is a logical container for related Azure resources.

Question 32

Domain 2 — Azure architecture and services | Objective 2.05 | Easy | Multiple Choice

Which Azure scope is primarily a billing and administrative boundary?

- A. Subnet
- B. Subscription
- C. Blob container
- D. Availability set

Answer: B. Subscription

This is correct because Subscription is the best match for the scenario or definition being tested. In this objective, the key idea is billing and administrative boundary for Azure resources. That aligns with objective 2.05 (Describe subscriptions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Subnet:** This is wrong because Subnet refers to logical IP segment inside a VNet., whereas the best answer is Subscription for the requirement described.
- C. Blob container:** This option does not best match the definition or requirement in the question. The strongest answer is Subscription.
- D. Availability set:** This option does not best match the definition or requirement in the question. The strongest answer is Subscription.

Question 33

Domain 2 — Azure architecture and services | Objective 2.06 | Easy | Multiple Choice

What is the main purpose of a management group?

- A. To organize subscriptions for governance at scale
- B. To store logs for Azure Monitor
- C. To mount file shares
- D. To host Azure Functions

Answer: A. To organize subscriptions for governance at scale

This is correct because To organize subscriptions for governance at scale is the best match for the scenario or definition being tested. In this objective, the key idea is In Azure, you use them to apply governance like policy and RBAC across many subscriptions at once. That aligns with objective 2.06 (Describe management groups) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. To store logs for Azure Monitor: This option does not best match the definition or requirement in the question. The strongest answer is To organize subscriptions for governance at scale.

C. To mount file shares: This option does not best match the definition or requirement in the question. The strongest answer is To organize subscriptions for governance at scale.

D. To host Azure Functions: This option does not best match the definition or requirement in the question. The strongest answer is To organize subscriptions for governance at scale.

Question 34

Domain 2 — Azure architecture and services | Objective 2.07 | Medium | Multiple Choice

Which option shows the Azure hierarchy from broadest scope to narrowest?

- A. Resource -> Resource group -> Subscription -> Management group
- B. Management group -> Subscription -> Resource group -> Resource
- C. Subscription -> Management group -> Resource -> Resource group
- D. Region -> Subscription -> Management group -> Resource

Answer: B. Management group -> Subscription -> Resource group -> Resource

This is correct because Management group -> Subscription -> Resource group -> Resource is the best match for the scenario or definition being tested. In this objective, the key idea is Settings like policy or RBAC can be assigned at higher scopes and inherited downward. That aligns with objective 2.07 (Describe the hierarchy of management groups, subscriptions, resource groups, and resources) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Resource -> Resource group -> Subscription -> Management group: This option does not best match the definition or requirement in the question. The strongest answer is Management group -> Subscription -> Resource group -> Resource.

C. Subscription -> Management group -> Resource -> Resource group: This option does not best match the definition or requirement in the question. The strongest answer is Management group -> Subscription -> Resource group -> Resource.

D. Region -> Subscription -> Management group -> Resource: This option does not best match the definition or requirement in the question. The strongest answer is Management group -> Subscription -> Resource group -> Resource.

Question 35

Domain 2 — Azure architecture and services | Objective 2.08 | Medium | Scenario

A team needs the most guest OS control for a legacy application. Which compute choice is best?

- A. Azure Functions
- B. Containers
- C. Virtual machines
- D. Azure DNS

Answer: C. Virtual machines

This is correct because Virtual machines is the best match for the scenario or definition being tested. In this objective, the key idea is customizable compute instances where you manage the guest OS. That aligns with objective 2.08 (Compare compute types: containers, virtual machines, and functions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Azure Functions: This is wrong because Azure Functions refers to serverless event-driven compute service., whereas the best answer is Virtual machines for the requirement described.

B. Containers: This is wrong because Containers refers to packaged application units that share an OS kernel and start quickly., whereas the best answer is Virtual machines for the requirement described.

D. Azure DNS: This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is Virtual machines for the requirement described.

Question 36

Domain 2 — Azure architecture and services | Objective 2.08 | Medium | Scenario

A team wants lightweight packaged deployment with fast startup and portability across environments. Which compute choice is best?

- A. Virtual machines
- B. Containers
- C. Availability sets
- D. Region pairs

Answer: B. Containers

This is correct because Containers is the best match for the scenario or definition being tested. In this objective, the key idea is packaged application units that share an OS kernel and start quickly. That aligns with objective 2.08 (Compare compute types: containers, virtual machines, and functions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Virtual machines: This is wrong because Virtual machines refers to customizable compute instances where you manage the guest OS., whereas the best answer is Containers for the requirement described.

C. Availability sets: This is wrong because Availability sets refers to VM placement feature that improves resilience against host/update-domain issues., whereas the best answer is Containers for the requirement described.

D. Region pairs: This option does not best match the definition or requirement in the question. The strongest answer is Containers.

Question 37

Domain 2 — Azure architecture and services | Objective 2.08 | Easy | Scenario

A small piece of code should run only in response to events without managing servers. Which compute choice is best?

- A. Azure Functions
- B. Virtual machines
- C. Azure Files
- D. ExpressRoute

Answer: A. Azure Functions

This is correct because Azure Functions is the best match for the scenario or definition being tested. In this objective, the key idea is serverless event-driven compute service. That aligns with objective 2.08 (Compare compute types: containers, virtual machines, and functions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Virtual machines: This is wrong because Virtual machines refers to customizable compute instances where you manage the guest OS., whereas the best answer is Azure Functions for the requirement described.

C. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Azure Functions for the requirement described.

D. ExpressRoute: This is wrong because ExpressRoute refers to private dedicated connectivity between your environment and Microsoft cloud., whereas the best answer is Azure Functions for the requirement described.

Question 38

Domain 2 — Azure architecture and services | Objective 2.09 | Medium | Multiple Choice

Which Azure service helps you deploy and manage many identical VMs that can scale together?

- A. Availability sets
- B. VM Scale Sets
- C. Azure Virtual Desktop
- D. Azure DNS

Answer: B. VM Scale Sets

This is correct because VM Scale Sets is the best match for the scenario or definition being tested. In this objective, the key idea is service for deploying and managing many similar VMs at scale. That aligns with objective 2.09 (Describe VM options: Azure VMs, VM Scale Sets, availability sets, and Azure Virtual Desktop) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Availability sets: This is wrong because Availability sets refers to VM placement feature that improves resilience against host/update-domain issues., whereas the best answer is VM Scale Sets for the requirement described.

C. Azure Virtual Desktop: This is wrong because Azure Virtual Desktop refers to Azure-hosted desktop and application virtualization service., whereas the best answer is VM Scale Sets for the requirement described.

D. Azure DNS: This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is VM Scale Sets for the requirement described.

Question 39

Domain 2 — Azure architecture and services | Objective 2.09 | Medium | Multiple Choice

Which feature is designed to improve VM resilience against host and update-domain issues rather than to autoscale a fleet?

- A. Availability sets
- B. VM Scale Sets
- C. Azure Functions
- D. Private endpoints

Answer: A. Availability sets

This is correct because Availability sets is the best match for the scenario or definition being tested. In this objective, the key idea is VM placement feature that improves resilience against host/update-domain issues. That aligns with objective 2.09 (Describe VM options: Azure VMs, VM Scale Sets, availability sets, and Azure Virtual Desktop) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. VM Scale Sets:** This is wrong because VM Scale Sets refers to service for deploying and managing many similar VMs at scale., whereas the best answer is Availability sets for the requirement described.
- C. Azure Functions:** This is wrong because Azure Functions refers to serverless event-driven compute service., whereas the best answer is Availability sets for the requirement described.
- D. Private endpoints:** This option does not best match the definition or requirement in the question. The strongest answer is Availability sets.

Question 40

Domain 2 — Azure architecture and services | Objective 2.09 | Medium | Multiple Choice

Which service provides desktop and application virtualization from Azure?

- A. Azure Virtual Desktop
- B. Azure Files
- C. Azure Policy
- D. Log Analytics

Answer: A. Azure Virtual Desktop

This is correct because Azure Virtual Desktop is the best match for the scenario or definition being tested. In this objective, the key idea is Azure-hosted desktop and application virtualization service. That aligns with objective 2.09 (Describe VM options: Azure VMs, VM Scale Sets, availability sets, and Azure Virtual Desktop) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Azure Files:** This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Azure Virtual Desktop for the requirement described.
- C. Azure Policy:** This is wrong because Azure Policy refers to governance service that evaluates and can enforce resource standards., whereas the best answer is Azure Virtual Desktop for the requirement described.
- D. Log Analytics:** This is wrong because Log Analytics refers to Azure Monitor log query and investigation experience/workspace., whereas the best answer is Azure Virtual Desktop for the requirement described.

Question 41

Domain 2 — Azure architecture and services | Objective 2.10 | Easy | Multiple Choice

Which of the following is a basic VM resource requirement you must size intentionally?

- A. vCPUs and memory
- B. Only tags
- C. Only a management group
- D. Only a DNS zone

Answer: A. vCPUs and memory

This is correct because vCPUs and memory is the best match for the scenario or definition being tested. In this objective, the key idea is Typical Azure VM dependencies include a virtual network, subnet, NIC, disk(s), and often public IP or private-only access, plus NSGs and identities as needed. That aligns with objective 2.10 (Describe the resources required for virtual machines) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Only tags:** This option does not best match the definition or requirement in the question. The strongest answer is vCPUs and memory.
- C. Only a management group:** This option does not best match the definition or requirement in the question. The strongest answer is vCPUs and memory.
- D. Only a DNS zone:** This option does not best match the definition or requirement in the question. The strongest answer is vCPUs and memory.

Question 42

Domain 2 — Azure architecture and services | Objective 2.11 | Medium | Scenario

A team wants to host a standard web app quickly with minimal platform management. Which option is usually the best starting point?

- A. Virtual machines
- B. Azure App Service Web Apps
- C. ExpressRoute
- D. Azure Data Box

Answer: B. Azure App Service Web Apps

This is correct because Azure App Service Web Apps is the best match for the scenario or definition being tested. In this objective, the key idea is managed PaaS hosting for web applications. That aligns with objective 2.11 (Describe application hosting options: web apps, containers, and virtual machines) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Virtual machines:** This is wrong because Virtual machines refers to customizable compute instances where you manage the guest OS., whereas the best answer is Azure App Service Web Apps for the requirement described.
- C. ExpressRoute:** This is wrong because ExpressRoute refers to private dedicated connectivity between your environment and Microsoft cloud., whereas the best answer is Azure App Service Web Apps for the requirement described.
- D. Azure Data Box:** This is wrong because Azure Data Box refers to physical Microsoft device/service for offline bulk data transfer., whereas the best answer is Azure App Service Web Apps for the requirement described.

Question 43

Domain 2 — Azure architecture and services | Objective 2.11 | Medium | Scenario

A team requires full OS and kernel-level customization for its web workload. Which hosting option is the clearest fit?

- A. Azure App Service Web Apps
- B. Containers
- C. Virtual machines
- D. Azure Files

Answer: C. Virtual machines

This is correct because Virtual machines is the best match for the scenario or definition being tested. In this objective, the key idea is customizable compute instances where you manage the guest OS. That aligns with objective 2.11 (Describe application hosting options: web apps, containers, and virtual machines) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Azure App Service Web Apps: This is wrong because Azure App Service Web Apps refers to managed PaaS hosting for web applications., whereas the best answer is Virtual machines for the requirement described.

B. Containers: This is wrong because Containers refers to packaged application units that share an OS kernel and start quickly., whereas the best answer is Virtual machines for the requirement described.

D. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Virtual machines for the requirement described.

Question 44

Domain 2 — Azure architecture and services | Objective 2.12 | Easy | Multiple Choice

What is an Azure Virtual Network (VNet)?

- A. A private networking boundary in Azure
- B. A pricing calculator worksheet
- C. A physical WAN cable
- D. An identity provider

Answer: A. A private networking boundary in Azure

This is correct because A private networking boundary in Azure is the best match for the scenario or definition being tested. In this objective, the key idea is VNets provide isolation, subnets divide address space, peering connects VNets over the Microsoft backbone, Azure DNS resolves names, VPN Gateway provides encrypted tunnels over the internet, and ExpressRoute provides dedicated private connectivity. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. A pricing calculator worksheet: This option does not best match the definition or requirement in the question. The strongest answer is A private networking boundary in Azure.

C. A physical WAN cable: This option does not best match the definition or requirement in the question. The strongest answer is A private networking boundary in Azure.

D. An identity provider: This option does not best match the definition or requirement in the question. The strongest answer is A private networking boundary in Azure.

Question 45

Domain 2 — Azure architecture and services | Objective 2.12 | Easy | Multiple Choice

What is a subnet?

- A. A separate Azure region
- B. A logical IP segment inside a VNet
- C. A region pair
- D. A governance assignment

Answer: B. A logical IP segment inside a VNet

This is correct because A logical IP segment inside a VNet is the best match for the scenario or definition being tested. In this objective, the key idea is VNets provide isolation, subnets divide address space, peering connects VNets over the Microsoft backbone, Azure DNS resolves names, VPN Gateway provides encrypted tunnels over the internet, and ExpressRoute provides dedicated private connectivity. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. A separate Azure region:** This option does not best match the definition or requirement in the question. The strongest answer is A logical IP segment inside a VNet.
- C. A region pair:** This option does not best match the definition or requirement in the question. The strongest answer is A logical IP segment inside a VNet.
- D. A governance assignment:** This option does not best match the definition or requirement in the question. The strongest answer is A logical IP segment inside a VNet.

Question 46

Domain 2 — Azure architecture and services | Objective 2.12 | Medium | Multiple Choice

Which feature provides direct VNet-to-VNet connectivity over the Microsoft backbone?

- A. VPN Gateway
- B. VNet peering
- C. Azure DNS
- D. Resource lock

Answer: B. VNet peering

This is correct because VNet peering is the best match for the scenario or definition being tested. In this objective, the key idea is direct VNet-to-VNet connectivity over Microsoft backbone. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. VPN Gateway:** This is wrong because VPN Gateway refers to encrypted connectivity over the public internet between networks., whereas the best answer is VNet peering for the requirement described.
- C. Azure DNS:** This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is VNet peering for the requirement described.

D. Resource lock: This option does not best match the definition or requirement in the question. The strongest answer is VNet peering.

Question 47

Domain 2 — Azure architecture and services | Objective 2.12 | Easy | Multiple Choice

Which Azure service is used for DNS hosting and name resolution?

- A. Azure DNS
- B. Azure Monitor
- C. Azure Files
- D. Application Insights

Answer: A. Azure DNS

This is correct because Azure DNS is the best match for the scenario or definition being tested. In this objective, the key idea is Azure service for DNS hosting and name resolution. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure Monitor: This is wrong because Azure Monitor refers to observability platform for metrics, logs, alerts, and analysis., whereas the best answer is Azure DNS for the requirement described.

C. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Azure DNS for the requirement described.

D. Application Insights: This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Azure DNS for the requirement described.

Question 48

Domain 2 — Azure architecture and services | Objective 2.12 | Medium | Scenario

An organization needs encrypted connectivity from on-premises to Azure over the public internet. Which service is the best fit?

- A. ExpressRoute
- B. VPN Gateway
- C. VNet peering
- D. Private endpoint

Answer: B. VPN Gateway

This is correct because VPN Gateway is the best match for the scenario or definition being tested. In this objective, the key idea is encrypted connectivity over the public internet between networks. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. ExpressRoute: This is wrong because ExpressRoute refers to private dedicated connectivity between your environment and Microsoft cloud., whereas the best answer is VPN Gateway for the requirement described.

C. VNet peering: This is wrong because VNet peering refers to direct VNet-to-VNet connectivity over Microsoft backbone., whereas the best answer is VPN Gateway for the requirement described.

D. Private endpoint: This is wrong because Private endpoint refers to private IP endpoint in a VNet for reaching a service through Private Link., whereas the best answer is VPN Gateway for the requirement described.

Question 49

Domain 2 — Azure architecture and services | Objective 2.12 | Medium | Scenario

An organization needs a private dedicated connection from on-premises to Microsoft cloud that does not traverse the public internet. Which service is the best fit?

- A. VPN Gateway
- B. VNet peering
- C. ExpressRoute
- D. Azure DNS

Answer: C. ExpressRoute

This is correct because ExpressRoute is the best match for the scenario or definition being tested. In this objective, the key idea is private dedicated connectivity between your environment and Microsoft cloud. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. VPN Gateway:** This is wrong because VPN Gateway refers to encrypted connectivity over the public internet between networks., whereas the best answer is ExpressRoute for the requirement described.
- B. VNet peering:** This is wrong because VNet peering refers to direct VNet-to-VNet connectivity over Microsoft backbone., whereas the best answer is ExpressRoute for the requirement described.
- D. Azure DNS:** This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is ExpressRoute for the requirement described.

Question 50

Domain 2 — Azure architecture and services | Objective 2.13 | Medium | Scenario

A team wants to access an Azure PaaS database through a private IP address inside its VNet. Which feature is the best answer?

- A. Public endpoint
- B. Private endpoint
- C. Region pair
- D. Availability set

Answer: B. Private endpoint

This is correct because Private endpoint is the best match for the scenario or definition being tested. In this objective, the key idea is private IP endpoint in a VNet for reaching a service through Private Link. That aligns with objective 2.13 (Define public and private endpoints) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Public endpoint:** This is wrong because Public endpoint refers to internet-reachable service endpoint., whereas the best answer is Private endpoint for the requirement described.
- C. Region pair:** This is wrong because Region pair refers to Microsoft-defined pairing of some Azure regions for certain resiliency scenarios., whereas the best answer is Private endpoint for the requirement described.

D. Availability set: This option does not best match the definition or requirement in the question. The strongest answer is Private endpoint.

Question 51

Domain 2 — Azure architecture and services | Objective 2.13 | Easy | Multiple Choice

Which endpoint type is reachable over the public internet by default?

- A. Private endpoint
- B. Public endpoint
- C. Subnet endpoint
- D. Management group endpoint

Answer: B. Public endpoint

This is correct because Public endpoint is the best match for the scenario or definition being tested. In this objective, the key idea is internet-reachable service endpoint. That aligns with objective 2.13 (Define public and private endpoints) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Private endpoint:** This is wrong because Private endpoint refers to private IP endpoint in a VNet for reaching a service through Private Link., whereas the best answer is Public endpoint for the requirement described.
- C. Subnet endpoint:** This option does not best match the definition or requirement in the question. The strongest answer is Public endpoint.
- D. Management group endpoint:** This option does not best match the definition or requirement in the question. The strongest answer is Public endpoint.

Question 52

Domain 2 — Azure architecture and services | Objective 2.14 | Easy | Multiple Choice

Which Azure Storage service is best for large amounts of unstructured object data such as images and video?

- A. Azure Files
- B. Blob Storage
- C. Managed disks
- D. Availability sets

Answer: B. Blob Storage

This is correct because Blob Storage is the best match for the scenario or definition being tested. In this objective, the key idea is object storage for large amounts of unstructured data. That aligns with objective 2.14 (Compare Azure Storage services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Azure Files:** This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Blob Storage for the requirement described.
- C. Managed disks:** This is wrong because Managed disks refers to persistent block storage for Azure VMs., whereas the best answer is Blob Storage for the requirement described.

D. Availability sets: This is wrong because Availability sets refers to VM placement feature that improves resilience against host/update-domain issues., whereas the best answer is Blob Storage for the requirement described.

Question 53

Domain 2 — Azure architecture and services | Objective 2.14 | Easy | Multiple Choice

Which Azure service provides managed file shares over SMB or NFS?

- A. Blob Storage
- B. Azure Files
- C. Table Storage
- D. Application Insights

Answer: B. Azure Files

This is correct because Azure Files is the best match for the scenario or definition being tested. In this objective, the key idea is managed file shares over SMB or NFS. That aligns with objective 2.14 (Compare Azure Storage services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Blob Storage:** This is wrong because Blob Storage refers to object storage for large amounts of unstructured data., whereas the best answer is Azure Files for the requirement described.
- C. Table Storage:** This is wrong because Table Storage refers to simple NoSQL key/value-like storage service., whereas the best answer is Azure Files for the requirement described.
- D. Application Insights:** This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Azure Files for the requirement described.

Question 54

Domain 2 — Azure architecture and services | Objective 2.14 | Easy | Multiple Choice

Which Azure Storage service is intended for simple message queuing?

- A. Queue Storage
- B. Blob Storage
- C. Azure Files
- D. Log Analytics

Answer: A. Queue Storage

This is correct because Queue Storage is the best match for the scenario or definition being tested. In this objective, the key idea is simple message queue storage service. That aligns with objective 2.14 (Compare Azure Storage services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Blob Storage:** This is wrong because Blob Storage refers to object storage for large amounts of unstructured data., whereas the best answer is Queue Storage for the requirement described.
- C. Azure Files:** This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Queue Storage for the requirement described.
- D. Log Analytics:** This is wrong because Log Analytics refers to Azure Monitor log query and investigation experience/workspace., whereas the best answer is Queue Storage for the requirement described.

Question 55

Domain 2 — Azure architecture and services | Objective 2.14 | Easy | Multiple Choice

Which Azure Storage option provides persistent block storage for virtual machines?

- A. Managed disks
- B. Azure Files
- C. Table Storage
- D. Azure Monitor alerts

Answer: A. Managed disks

This is correct because Managed disks is the best match for the scenario or definition being tested. In this objective, the key idea is persistent block storage for Azure VMs. That aligns with objective 2.14 (Compare Azure Storage services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Managed disks for the requirement described.

C. Table Storage: This is wrong because Table Storage refers to simple NoSQL key/value-like storage service., whereas the best answer is Managed disks for the requirement described.

D. Azure Monitor alerts: This is wrong because Azure Monitor alerts refers to notification and action capability triggered by monitored conditions., whereas the best answer is Managed disks for the requirement described.

Question 56

Domain 2 — Azure architecture and services | Objective 2.14 | Medium | Multiple Choice

Which Azure Storage service is the best fit for simple NoSQL key/value-like data?

- A. Table Storage
- B. Azure Files
- C. Blob Storage
- D. VPN Gateway

Answer: A. Table Storage

This is correct because Table Storage is the best match for the scenario or definition being tested. In this objective, the key idea is simple NoSQL key/value-like storage service. That aligns with objective 2.14 (Compare Azure Storage services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Table Storage for the requirement described.

C. Blob Storage: This is wrong because Blob Storage refers to object storage for large amounts of unstructured data., whereas the best answer is Table Storage for the requirement described.

D. VPN Gateway: This is wrong because VPN Gateway refers to encrypted connectivity over the public internet between networks., whereas the best answer is Table Storage for the requirement described.

Question 57

Domain 2 — Azure architecture and services | Objective 2.15 | Easy | Multiple Choice

Which Blob tier is best for data that is accessed frequently?

- A. Archive tier
- B. Cold tier
- C. Hot tier
- D. Cool tier

Answer: C. Hot tier

This is correct because Hot tier is the best match for the scenario or definition being tested. In this objective, the key idea is Blob tier for frequently accessed data. That aligns with objective 2.15 (Describe storage tiers) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Archive tier:** This is wrong because Archive tier refers to offline Blob tier for rarely accessed data with slower retrieval., whereas the best answer is Hot tier for the requirement described.
- B. Cold tier:** This is wrong because Cold tier refers to Blob tier for rarely accessed online data., whereas the best answer is Hot tier for the requirement described.
- D. Cool tier:** This is wrong because Cool tier refers to Blob tier for infrequently accessed online data., whereas the best answer is Hot tier for the requirement described.

Question 58

Domain 2 — Azure architecture and services | Objective 2.15 | Medium | Scenario

Which Blob tier is the best answer for data that is rarely accessed and can tolerate slower retrieval after rehydration?

- A. Hot tier
- B. Cool tier
- C. Archive tier
- D. Premium SSD

Answer: C. Archive tier

This is correct because Archive tier is the best match for the scenario or definition being tested. In this objective, the key idea is offline Blob tier for rarely accessed data with slower retrieval. That aligns with objective 2.15 (Describe storage tiers) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Hot tier:** This is wrong because Hot tier refers to Blob tier for frequently accessed data., whereas the best answer is Archive tier for the requirement described.
- B. Cool tier:** This is wrong because Cool tier refers to Blob tier for infrequently accessed online data., whereas the best answer is Archive tier for the requirement described.
- D. Premium SSD:** This option does not best match the definition or requirement in the question. The strongest answer is Archive tier.

Question 59

Domain 2 — Azure architecture and services | Objective 2.15 | Medium | Multiple Choice

Which statement about the cool and cold tiers is the best answer?

- A. They are offline archive tiers
- B. They are online tiers for infrequently or rarely accessed data

- C. They are used only for VMs
- D. They remove all access charges

Answer: B. They are online tiers for infrequently or rarely accessed data

This is correct because They are online tiers for infrequently or rarely accessed data is the best match for the scenario or definition being tested. In this objective, the key idea is For Blob Storage, the core current tiers are hot, cool, cold, and archive; hotter tiers cost more to store but less to access, while archive is cheapest to store but slowest to retrieve. That aligns with objective 2.15 (Describe storage tiers) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. They are offline archive tiers: This option does not best match the definition or requirement in the question. The strongest answer is They are online tiers for infrequently or rarely accessed data.

C. They are used only for VMs: This option does not best match the definition or requirement in the question. The strongest answer is They are online tiers for infrequently or rarely accessed data.

D. They remove all access charges: This option does not best match the definition or requirement in the question. The strongest answer is They are online tiers for infrequently or rarely accessed data.

Question 60

Domain 2 — Azure architecture and services | Objective 2.16 | Easy | Multiple Choice

Which storage redundancy option keeps copies within a single location in one region and is usually the lowest-cost basic choice?

- A. LRS
- B. ZRS
- C. GRS
- D. RA-GZRS

Answer: A. LRS

This is correct because LRS is the best match for the scenario or definition being tested. In this objective, the key idea is locally redundant storage with copies in a single location. That aligns with objective 2.16 (Describe redundancy options) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. ZRS: This is wrong because ZRS refers to zone-redundant storage with copies across availability zones in a region., whereas the best answer is LRS for the requirement described.

C. GRS: This is wrong because GRS refers to geo-redundant storage with asynchronous replication to a secondary region., whereas the best answer is LRS for the requirement described.

D. RA-GZRS: This is wrong because RA-GZRS refers to GZRS plus read access to the secondary region., whereas the best answer is LRS for the requirement described.

Question 61

Domain 2 — Azure architecture and services | Objective 2.16 | Medium | Multiple Choice

Which redundancy option keeps synchronous copies across multiple availability zones in one region?

- A. LRS
- B. ZRS
- C. GRS
- D. RA-GRS

Answer: B. ZRS

This is correct because ZRS is the best match for the scenario or definition being tested. In this objective, the key idea is zone-redundant storage with copies across availability zones in a region. That aligns with objective 2.16 (Describe redundancy options) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. LRS:** This is wrong because LRS refers to locally redundant storage with copies in a single location., whereas the best answer is ZRS for the requirement described.
- C. GRS:** This is wrong because GRS refers to geo-redundant storage with asynchronous replication to a secondary region., whereas the best answer is ZRS for the requirement described.
- D. RA-GRS:** This is wrong because RA-GRS refers to GRS plus read access to the secondary region., whereas the best answer is ZRS for the requirement described.

Question 62

Domain 2 — Azure architecture and services | Objective 2.16 | Medium | Scenario

A requirement states that storage data must be readable from the secondary region if the primary region is unavailable. Which option is the best match?

- A. GRS
- B. RA-GRS
- C. LRS
- D. ZRS

Answer: B. RA-GRS

This is correct because RA-GRS is the best match for the scenario or definition being tested. In this objective, the key idea is GRS plus read access to the secondary region. That aligns with objective 2.16 (Describe redundancy options) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. GRS:** This is wrong because GRS refers to geo-redundant storage with asynchronous replication to a secondary region., whereas the best answer is RA-GRS for the requirement described.
- C. LRS:** This is wrong because LRS refers to locally redundant storage with copies in a single location., whereas the best answer is RA-GRS for the requirement described.
- D. ZRS:** This is wrong because ZRS refers to zone-redundant storage with copies across availability zones in a region., whereas the best answer is RA-GRS for the requirement described.

Question 63

Domain 2 — Azure architecture and services | Objective 2.16 | Tricky | Scenario

Which redundancy option combines zone-level protection in the primary region with geo-replication to another region?

- A. GRS
- B. GZRS
- C. LRS
- D. RA-GRS

Answer: B. GZRS

This is correct because GZRS is the best match for the scenario or definition being tested. In this objective, the key idea is geo-zone-redundant storage combining zone redundancy and geo replication. That aligns with objective 2.16 (Describe redundancy options) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. GRS:** This is wrong because GRS refers to geo-redundant storage with asynchronous replication to a secondary region., whereas the best answer is GZRS for the requirement described.
- C. LRS:** This is wrong because LRS refers to locally redundant storage with copies in a single location., whereas the best answer is GZRS for the requirement described.
- D. RA-GRS:** This is wrong because RA-GRS refers to GRS plus read access to the secondary region., whereas the best answer is GZRS for the requirement described.

Question 64

Domain 2 — Azure architecture and services | Objective 2.17 | Easy | Multiple Choice

What is a storage account in Azure?

- A.** A top-level container exposing storage services and settings
- B.** A file share only
- C.** A VM operating system
- D.** A management group for blobs

Answer: A. A top-level container exposing storage services and settings

This is correct because A top-level container exposing storage services and settings is the best match for the scenario or definition being tested. In this objective, the key idea is For AZ-900, focus on the idea that storage account type affects which services and features are available, and that general-purpose v2 is the common recommended account type for many scenarios. That aligns with objective 2.17 (Describe storage account options and storage types) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. A file share only:** This option does not best match the definition or requirement in the question. The strongest answer is A top-level container exposing storage services and settings.
- C. A VM operating system:** This option does not best match the definition or requirement in the question. The strongest answer is A top-level container exposing storage services and settings.
- D. A management group for blobs:** This option does not best match the definition or requirement in the question. The strongest answer is A top-level container exposing storage services and settings.

Question 65

Domain 2 — Azure architecture and services | Objective 2.17 | Medium | Multiple Choice

Which storage account type is the common modern choice for many Azure Storage scenarios?

- A.** General-purpose v2 storage account
- B.** Only classic storage
- C.** Only archive storage account
- D.** Only VNet storage account

Answer: A. General-purpose v2 storage account

This is correct because General-purpose v2 storage account is the best match for the scenario or definition

being tested. In this objective, the key idea is the common modern storage account type supporting multiple storage services and features. That aligns with objective 2.17 (Describe storage account options and storage types) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Only classic storage: This option does not best match the definition or requirement in the question. The strongest answer is General-purpose v2 storage account.

C. Only archive storage account: This option does not best match the definition or requirement in the question. The strongest answer is General-purpose v2 storage account.

D. Only VNet storage account: This option does not best match the definition or requirement in the question. The strongest answer is General-purpose v2 storage account.

Domain 3 — Azure management and governance

Focus here on cost control, governance tools, deployment methods, and monitoring services.

Question 66

Domain 3 — Azure management and governance | Objective 3.01 | Easy | Multiple Choice

Which factor can affect Azure cost?

- A. Region choice
- B. Resource size and type
- C. Data transfer and redundancy choices
- D. All of the above

Answer: D. All of the above

This is correct because Azure cost is influenced by multiple architecture and usage factors, including region, service type and size, networking, and storage design choices.

Why the other options are wrong:

A. Region choice: This option does not best match the definition or requirement in the question. The strongest answer is All of the above.

B. Resource size and type: This option does not best match the definition or requirement in the question. The strongest answer is All of the above.

C. Data transfer and redundancy choices: This option does not best match the definition or requirement in the question. The strongest answer is All of the above.

Question 67

Domain 3 — Azure management and governance | Objective 3.01 | Medium | Scenario

Which scenario is most likely to cost more?

- A. A small VM running only during office hours
- B. A larger VM running 24/7 with premium disks and outbound traffic
- C. A stopped VM with no attached disks
- D. A tag applied to a resource

Answer: B. A larger VM running 24/7 with premium disks and outbound traffic

This is correct because A larger VM running 24/7 with premium disks and outbound traffic is the best match

for the scenario or definition being tested. In this objective, the key idea is Common cost drivers include resource type, consumption, region, outbound data transfer, licensing model, redundancy level, and commitment discounts. That aligns with objective 3.01 (Describe factors that can affect costs in Azure) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. A small VM running only during office hours: This option does not best match the definition or requirement in the question. The strongest answer is A larger VM running 24/7 with premium disks and outbound traffic.

C. A stopped VM with no attached disks: This option does not best match the definition or requirement in the question. The strongest answer is A larger VM running 24/7 with premium disks and outbound traffic.

D. A tag applied to a resource: This option does not best match the definition or requirement in the question. The strongest answer is A larger VM running 24/7 with premium disks and outbound traffic.

Question 68

Domain 3 — Azure management and governance | Objective 3.02 | Easy | Multiple Choice

Which tool should you use before deployment to estimate monthly Azure cost?

- A. Cost Management
- B. Pricing Calculator
- C. Azure Advisor
- D. Azure Service Health

Answer: B. Pricing Calculator

This is correct because Pricing Calculator is the best match for the scenario or definition being tested. In this objective, the key idea is tool for estimating Azure cost before deployment. That aligns with objective 3.02 (Explore the pricing calculator) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Cost Management: This is wrong because Cost Management refers to toolset for analyzing and managing actual Azure spend after deployment., whereas the best answer is Pricing Calculator for the requirement described.

C. Azure Advisor: This is wrong because Azure Advisor refers to personalized recommendation service for best practices and optimization., whereas the best answer is Pricing Calculator for the requirement described.

D. Azure Service Health: This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is Pricing Calculator for the requirement described.

Question 69

Domain 3 — Azure management and governance | Objective 3.03 | Easy | Multiple Choice

Which capability helps you analyze actual Azure spending after resources are already running?

- A. Pricing Calculator
- B. Cost Management
- C. Azure DNS
- D. Application Insights

Answer: B. Cost Management

This is correct because Cost Management is the best match for the scenario or definition being tested. In this objective, the key idea is toolset for analyzing and managing actual Azure spend after deployment. That aligns with objective 3.03 (Describe cost management capabilities in Azure) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Pricing Calculator: This is wrong because Pricing Calculator refers to tool for estimating Azure cost before deployment., whereas the best answer is Cost Management for the requirement described.

C. Azure DNS: This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is Cost Management for the requirement described.

D. Application Insights: This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Cost Management for the requirement described.

Question 70

Domain 3 — Azure management and governance | Objective 3.03 | Medium | Scenario

A finance lead wants to create budgets and review current spend trends across subscriptions. Which capability is the best fit?

- A. Cost Management
- B. Pricing Calculator
- C. Azure Files
- D. Azure Virtual Desktop

Answer: A. Cost Management

This is correct because Cost Management is the best match for the scenario or definition being tested. In this objective, the key idea is toolset for analyzing and managing actual Azure spend after deployment. That aligns with objective 3.03 (Describe cost management capabilities in Azure) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Pricing Calculator: This is wrong because Pricing Calculator refers to tool for estimating Azure cost before deployment., whereas the best answer is Cost Management for the requirement described.

C. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Cost Management for the requirement described.

D. Azure Virtual Desktop: This is wrong because Azure Virtual Desktop refers to Azure-hosted desktop and application virtualization service., whereas the best answer is Cost Management for the requirement described.

Question 71

Domain 3 — Azure management and governance | Objective 3.04 | Easy | Multiple Choice

What is the main purpose of tags in Azure?

- A. To provide metadata labels for organization and reporting
- B. To grant permissions to users
- C. To create storage redundancy
- D. To run serverless code

Answer: A. To provide metadata labels for organization and reporting

This is correct because To provide metadata labels for organization and reporting is the best match for the scenario or definition being tested. In this objective, the key idea is They are commonly used for organization, chargeback/showback, ownership, environment labeling, and cost reporting. That aligns with objective 3.04 (Describe the purpose of tags) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. To grant permissions to users: This option does not best match the definition or requirement in the question. The strongest answer is To provide metadata labels for organization and reporting.

C. To create storage redundancy: This option does not best match the definition or requirement in the question. The strongest answer is To provide metadata labels for organization and reporting.

D. To run serverless code: This option does not best match the definition or requirement in the question. The strongest answer is To provide metadata labels for organization and reporting.

Question 72

Domain 3 — Azure management and governance | Objective 3.04 | Medium | Multiple Choice

Which statement about tags is correct?

- A. Tags directly deny deployments in unapproved regions
- B. Tags are metadata labels and do not by themselves enforce governance
- C. Tags are the same thing as RBAC assignments
- D. Tags are required for all resources to run

Answer: B. Tags are metadata labels and do not by themselves enforce governance

This is correct because Tags are metadata labels and do not by themselves enforce governance is the best match for the scenario or definition being tested. In this objective, the key idea is They are commonly used for organization, chargeback/showback, ownership, environment labeling, and cost reporting. That aligns with objective 3.04 (Describe the purpose of tags) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Tags directly deny deployments in unapproved regions: This option does not best match the definition or requirement in the question. The strongest answer is Tags are metadata labels and do not by themselves enforce governance.

C. Tags are the same thing as RBAC assignments: This option does not best match the definition or requirement in the question. The strongest answer is Tags are metadata labels and do not by themselves enforce governance.

D. Tags are required for all resources to run: This option does not best match the definition or requirement in the question. The strongest answer is Tags are metadata labels and do not by themselves enforce governance.

Question 73

Domain 3 — Azure management and governance | Objective 3.05 | Easy | Multiple Choice

Microsoft Purview is most closely associated with which area?

- A. Data governance, data security, and compliance
- B. VM autoscaling
- C. DNS hosting
- D. Network peering

Answer: A. Data governance, data security, and compliance

This is correct because Data governance, data security, and compliance is the best match for the scenario or definition being tested. In this objective, the key idea is For AZ-900, remember the high-level purpose: help organizations discover, understand, govern, and protect data and support compliance goals. That aligns with objective 3.05 (Describe the purpose of Microsoft Purview in Azure) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. VM autoscaling: This option does not best match the definition or requirement in the question. The strongest answer is Data governance, data security, and compliance.

C. DNS hosting: This option does not best match the definition or requirement in the question. The strongest answer is Data governance, data security, and compliance.

D. Network peering: This option does not best match the definition or requirement in the question. The strongest answer is Data governance, data security, and compliance.

Question 74

Domain 3 — Azure management and governance | Objective 3.06 | Easy | Multiple Choice

Which Azure service evaluates resources against rules and can enforce standards such as allowed locations or required tags?

- A. Azure Policy
- B. Azure RBAC
- C. Application Insights
- D. Azure Data Box

Answer: A. Azure Policy

This is correct because Azure Policy is the best match for the scenario or definition being tested. In this objective, the key idea is governance service that evaluates and can enforce resource standards. That aligns with objective 3.06 (Describe the purpose of Azure Policy) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure RBAC: This is wrong because Azure RBAC refers to role-based authorization system controlling who can do what at which scope., whereas the best answer is Azure Policy for the requirement described.

C. Application Insights: This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Azure Policy for the requirement described.

D. Azure Data Box: This is wrong because Azure Data Box refers to physical Microsoft device/service for offline bulk data transfer., whereas the best answer is Azure Policy for the requirement described.

Question 75

Domain 3 — Azure management and governance | Objective 3.06 | Medium | Scenario

A company wants to deny creation of resources outside approved regions. Which service is the best match?

- A. Azure Policy
- B. Resource locks
- C. Azure Monitor
- D. Azure Files

Answer: A. Azure Policy

This is correct because Azure Policy is the best match for the scenario or definition being tested. In this objective, the key idea is governance service that evaluates and can enforce resource standards. That aligns with objective 3.06 (Describe the purpose of Azure Policy) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Resource locks: This is wrong because Resource locks refers to change-protection feature that blocks deletion or modification., whereas the best answer is Azure Policy for the requirement described.

C. Azure Monitor: This is wrong because Azure Monitor refers to observability platform for metrics, logs, alerts, and analysis., whereas the best answer is Azure Policy for the requirement described.

D. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Azure Policy for the requirement described.

Question 76

Domain 3 — Azure management and governance | Objective 3.07 | Easy | Multiple Choice

What is the main purpose of resource locks?

- A. To prevent accidental deletion or modification
- B. To estimate cost before deployment
- C. To host file shares
- D. To provide DNS resolution

Answer: A. To prevent accidental deletion or modification

This is correct because To prevent accidental deletion or modification is the best match for the scenario or definition being tested. In this objective, the key idea is The key lock types are delete (CanNotDelete) and read-only. That aligns with objective 3.07 (Describe the purpose of resource locks) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. To estimate cost before deployment: This option does not best match the definition or requirement in the question. The strongest answer is To prevent accidental deletion or modification.

C. To host file shares: This option does not best match the definition or requirement in the question. The strongest answer is To prevent accidental deletion or modification.

D. To provide DNS resolution: This option does not best match the definition or requirement in the question. The strongest answer is To prevent accidental deletion or modification.

Question 77

Domain 3 — Azure management and governance | Objective 3.07 | Medium | Multiple Choice

Which lock type blocks both modification and deletion?

- A. CanNotDelete
- B. ReadOnly
- C. Archive
- D. Reader

Answer: B. ReadOnly

This is correct because ReadOnly is the best match for the scenario or definition being tested. In this

objective, the key idea is The key lock types are delete (CanNotDelete) and read-only. That aligns with objective 3.07 (Describe the purpose of resource locks) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. CanNotDelete: This option does not best match the definition or requirement in the question. The strongest answer is ReadOnly.

C. Archive: This option does not best match the definition or requirement in the question. The strongest answer is ReadOnly.

D. Reader: This option does not best match the definition or requirement in the question. The strongest answer is ReadOnly.

Question 78

Domain 3 — Azure management and governance | Objective 3.08 | Easy | Multiple Choice

Which tool is the primary browser-based graphical interface for Azure?

- A. Azure portal
- B. Azure CLI
- C. Azure PowerShell
- D. AzCopy

Answer: A. Azure portal

This is correct because Azure portal is the best match for the scenario or definition being tested. In this objective, the key idea is browser-based graphical management interface for Azure. That aligns with objective 3.08 (Describe the Azure portal) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure CLI: This is wrong because Azure CLI refers to cross-platform command-line interface for Azure., whereas the best answer is Azure portal for the requirement described.

C. Azure PowerShell: This is wrong because Azure PowerShell refers to PowerShell cmdlets and module set for Azure administration., whereas the best answer is Azure portal for the requirement described.

D. AzCopy: This is wrong because AzCopy refers to command-line tool for bulk data transfer to and from Azure Storage., whereas the best answer is Azure portal for the requirement described.

Question 79

Domain 3 — Azure management and governance | Objective 3.09 | Easy | Multiple Choice

What is Azure Cloud Shell?

- A. A browser-hosted shell that can run Azure CLI or Azure PowerShell
- B. A storage redundancy mode
- C. A VM backup tool
- D. A desktop virtualization service

Answer: A. A browser-hosted shell that can run Azure CLI or Azure PowerShell

This is correct because A browser-hosted shell that can run Azure CLI or Azure PowerShell is the best match for the scenario or definition being tested. In this objective, the key idea is It lets you run Azure CLI or Azure PowerShell without first installing them locally. That aligns with objective 3.09 (Describe Azure Cloud Shell, including Azure CLI and Azure PowerShell) and the guide section that explains the distinction and

common exam trap.

Why the other options are wrong:

B. A storage redundancy mode: This option does not best match the definition or requirement in the question. The strongest answer is A browser-hosted shell that can run Azure CLI or Azure PowerShell.

C. A VM backup tool: This option does not best match the definition or requirement in the question. The strongest answer is A browser-hosted shell that can run Azure CLI or Azure PowerShell.

D. A desktop virtualization service: This option does not best match the definition or requirement in the question. The strongest answer is A browser-hosted shell that can run Azure CLI or Azure PowerShell.

Question 80

Domain 3 — Azure management and governance | Objective 3.09 | Easy | Multiple Choice

Which tool is the cross-platform command-line interface for Azure?

- A. Azure CLI
- B. Azure portal
- C. Azure Monitor
- D. Azure Service Health

Answer: A. Azure CLI

This is correct because Azure CLI is the best match for the scenario or definition being tested. In this objective, the key idea is cross-platform command-line interface for Azure. That aligns with objective 3.09 (Describe Azure Cloud Shell, including Azure CLI and Azure PowerShell) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure portal: This is wrong because Azure portal refers to browser-based graphical management interface for Azure., whereas the best answer is Azure CLI for the requirement described.

C. Azure Monitor: This is wrong because Azure Monitor refers to observability platform for metrics, logs, alerts, and analysis., whereas the best answer is Azure CLI for the requirement described.

D. Azure Service Health: This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is Azure CLI for the requirement described.

Question 81

Domain 3 — Azure management and governance | Objective 3.09 | Easy | Multiple Choice

Which tool is the PowerShell-centric command option for Azure administration?

- A. Azure PowerShell
- B. Azure DNS
- C. Azure Data Box
- D. Azure App Service Web Apps

Answer: A. Azure PowerShell

This is correct because Azure PowerShell is the best match for the scenario or definition being tested. In this objective, the key idea is PowerShell cmdlets and module set for Azure administration. That aligns with objective 3.09 (Describe Azure Cloud Shell, including Azure CLI and Azure PowerShell) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure DNS: This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is Azure PowerShell for the requirement described.

C. Azure Data Box: This is wrong because Azure Data Box refers to physical Microsoft device/service for offline bulk data transfer., whereas the best answer is Azure PowerShell for the requirement described.

D. Azure App Service Web Apps: This is wrong because Azure App Service Web Apps refers to managed PaaS hosting for web applications., whereas the best answer is Azure PowerShell for the requirement described.

Question 82

Domain 3 — Azure management and governance | Objective 3.10 | Medium | Multiple Choice

What is Azure Arc mainly used for?

- A. Extending Azure management to on-premises and other clouds
- B. Creating private endpoints
- C. Replacing Microsoft Entra ID
- D. Running archive storage

Answer: A. Extending Azure management to on-premises and other clouds

This is correct because Extending Azure management to on-premises and other clouds is the best match for the scenario or definition being tested. In this objective, the key idea is At AZ-900 level, remember Arc as a bridge that lets you manage more things with Azure-style tooling and governance. That aligns with objective 3.10 (Describe the purpose of Azure Arc) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Creating private endpoints: This option does not best match the definition or requirement in the question. The strongest answer is Extending Azure management to on-premises and other clouds.

C. Replacing Microsoft Entra ID: This option does not best match the definition or requirement in the question. The strongest answer is Extending Azure management to on-premises and other clouds.

D. Running archive storage: This option does not best match the definition or requirement in the question. The strongest answer is Extending Azure management to on-premises and other clouds.

Question 83

Domain 3 — Azure management and governance | Objective 3.11 | Easy | Multiple Choice

What is infrastructure as code (IaC)?

- A. Defining infrastructure in files for repeatable deployment
- B. Using only the portal for manual configuration
- C. A storage synchronization feature
- D. A DNS failover pattern

Answer: A. Defining infrastructure in files for repeatable deployment

This is correct because Defining infrastructure in files for repeatable deployment is the best match for the scenario or definition being tested. In this objective, the key idea is In Azure, IaC reduces manual setup drift and supports repeatable environments through declarative definitions such as ARM templates. That aligns with objective 3.11 (Describe infrastructure as code (IaC)) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Using only the portal for manual configuration:** This option does not best match the definition or requirement in the question. The strongest answer is Defining infrastructure in files for repeatable deployment.
- C. A storage synchronization feature:** This option does not best match the definition or requirement in the question. The strongest answer is Defining infrastructure in files for repeatable deployment.
- D. A DNS failover pattern:** This option does not best match the definition or requirement in the question. The strongest answer is Defining infrastructure in files for repeatable deployment.

Question 84

Domain 3 — Azure management and governance | Objective 3.12 | Easy | Multiple Choice

What is Azure Resource Manager (ARM)?

- A. Azure deployment and management control plane
- B. A hardware appliance for migration
- C. A pricing commitment model
- D. A desktop image

Answer: A. Azure deployment and management control plane

This is correct because Azure deployment and management control plane is the best match for the scenario or definition being tested. In this objective, the key idea is ARM provides consistent APIs, scoping, RBAC integration, and template-driven deployment across Azure. That aligns with objective 3.12 (Describe Azure Resource Manager (ARM) and ARM templates) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. A hardware appliance for migration:** This option does not best match the definition or requirement in the question. The strongest answer is Azure deployment and management control plane.
- C. A pricing commitment model:** This option does not best match the definition or requirement in the question. The strongest answer is Azure deployment and management control plane.
- D. A desktop image:** This option does not best match the definition or requirement in the question. The strongest answer is Azure deployment and management control plane.

Question 85

Domain 3 — Azure management and governance | Objective 3.12 | Easy | Multiple Choice

What are ARM templates?

- A. JSON-based declarative templates for Azure deployments
- B. Excel spreadsheets for cost tracking
- C. DNS zone files
- D. Security incident reports

Answer: A. JSON-based declarative templates for Azure deployments

This is correct because JSON-based declarative templates for Azure deployments is the best match for the scenario or definition being tested. In this objective, the key idea is ARM provides consistent APIs, scoping, RBAC integration, and template-driven deployment across Azure. That aligns with objective 3.12 (Describe Azure Resource Manager (ARM) and ARM templates) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Excel spreadsheets for cost tracking:** This option does not best match the definition or requirement in the question. The strongest answer is JSON-based declarative templates for Azure deployments.
- C. DNS zone files:** This option does not best match the definition or requirement in the question. The strongest answer is JSON-based declarative templates for Azure deployments.
- D. Security incident reports:** This option does not best match the definition or requirement in the question. The strongest answer is JSON-based declarative templates for Azure deployments.

Question 86

Domain 3 — Azure management and governance | Objective 3.12 | Medium | Scenario

A team wants consistent repeatable deployments of the same environment into dev, test, and prod. Which option is the best answer?

- A. ARM templates
- B. Azure Service Health
- C. Resource locks
- D. Azure Files

Answer: A. ARM templates

This is correct because ARM templates is the best match for the scenario or definition being tested. In this objective, the key idea is JSON-based declarative templates for Azure deployments. That aligns with objective 3.12 (Describe Azure Resource Manager (ARM) and ARM templates) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure Service Health: This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is ARM templates for the requirement described.

C. Resource locks: This is wrong because Resource locks refers to change-protection feature that blocks deletion or modification., whereas the best answer is ARM templates for the requirement described.

D. Azure Files: This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is ARM templates for the requirement described.

Question 87

Domain 3 — Azure management and governance | Objective 3.13 | Easy | Multiple Choice

Which service gives personalized best-practice recommendations about cost, reliability, performance, security, and operations?

- A. Azure Advisor
- B. Azure Service Health
- C. Azure DNS
- D. Microsoft Purview

Answer: A. Azure Advisor

This is correct because Azure Advisor is the best match for the scenario or definition being tested. In this objective, the key idea is personalized recommendation service for best practices and optimization. That aligns with objective 3.13 (Describe the purpose of Azure Advisor) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

B. Azure Service Health: This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is Azure Advisor for the requirement described.

C. Azure DNS: This is wrong because Azure DNS refers to Azure service for DNS hosting and name resolution., whereas the best answer is Azure Advisor for the requirement described.

D. Microsoft Purview: This is wrong because Microsoft Purview refers to Microsoft portfolio for data governance, data security, and data compliance., whereas the best answer is Azure Advisor for the requirement described.

Question 88

Domain 3 — Azure management and governance | Objective 3.14 | Easy | Multiple Choice

Which service provides personalized communications about Azure incidents, maintenance, and advisories that affect your resources?

- A. Azure Monitor
- B. Azure Service Health
- C. Azure Advisor
- D. Azure Arc

Answer: B. Azure Service Health

This is correct because Azure Service Health is the best match for the scenario or definition being tested. In this objective, the key idea is personalized view of Azure incidents, maintenance, and advisories that affect you. That aligns with objective 3.14 (Describe Azure Service Health) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

A. Azure Monitor: This is wrong because Azure Monitor refers to observability platform for metrics, logs, alerts, and analysis., whereas the best answer is Azure Service Health for the requirement described.

C. Azure Advisor: This is wrong because Azure Advisor refers to personalized recommendation service for best practices and optimization., whereas the best answer is Azure Service Health for the requirement described.

D. Azure Arc: This is wrong because Azure Arc refers to service that extends Azure management to on-premises and other clouds., whereas the best answer is Azure Service Health for the requirement described.

Question 89

Domain 3 — Azure management and governance | Objective 3.15 | Easy | Multiple Choice

Which service is the overall observability umbrella for metrics, logs, and alerts in Azure?

- A. Azure Monitor
- B. Application Insights
- C. Azure Policy
- D. Cost Management

Answer: A. Azure Monitor

This is correct because Azure Monitor is the best match for the scenario or definition being tested. In this objective, the key idea is observability platform for metrics, logs, alerts, and analysis. That aligns with objective 3.15 (Describe Azure Monitor, including Log Analytics, Azure Monitor alerts, and Application Insights) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Application Insights:** This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Azure Monitor for the requirement described.
- C. Azure Policy:** This is wrong because Azure Policy refers to governance service that evaluates and can enforce resource standards., whereas the best answer is Azure Monitor for the requirement described.
- D. Cost Management:** This is wrong because Cost Management refers to toolset for analyzing and managing actual Azure spend after deployment., whereas the best answer is Azure Monitor for the requirement described.

Question 90

Domain 3 — Azure management and governance | Objective 3.15 | Medium | Multiple Choice

Which component is mainly used to query and investigate log data collected through Azure Monitor?

- A. Azure Service Health
- B. Log Analytics
- C. Azure RBAC
- D. Azure Arc

Answer: B. Log Analytics

This is correct because Log Analytics is the best match for the scenario or definition being tested. In this objective, the key idea is Azure Monitor log query and investigation experience/workspace. That aligns with objective 3.15 (Describe Azure Monitor, including Log Analytics, Azure Monitor alerts, and Application Insights) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Azure Service Health:** This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is Log Analytics for the requirement described.
- C. Azure RBAC:** This is wrong because Azure RBAC refers to role-based authorization system controlling who can do what at which scope., whereas the best answer is Log Analytics for the requirement described.
- D. Azure Arc:** This is wrong because Azure Arc refers to service that extends Azure management to on-premises and other clouds., whereas the best answer is Log Analytics for the requirement described.

Mixed final mini-mock exam

Treat this section like a final short confidence check. Answer first, then read the explanation only after committing to a choice.

Question 91

Mixed final mini-mock exam | Objective 1.15 | Tricky | Scenario

A company wants to deploy a custom application quickly, avoid patching the OS, and keep control over the application code and configuration. Which service model is the best fit?

- A. SaaS
- B. PaaS
- C. IaaS
- D. Private cloud

Answer: B. PaaS

This is correct because PaaS is the best match for the scenario or definition being tested. In this objective, the key idea is platform as a service; you deploy code or data platforms without managing most OS plumbing. That aligns with objective 1.15 (Identify appropriate use cases for IaaS, PaaS, and SaaS) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. SaaS:** This is wrong because SaaS refers to software as a service delivered as a complete application., whereas the best answer is PaaS for the requirement described.
- C. IaaS:** This is wrong because IaaS refers to infrastructure as a service; you manage more of the OS and application stack., whereas the best answer is PaaS for the requirement described.
- D. Private cloud:** This is wrong because Private cloud refers to cloud environment dedicated to one organization., whereas the best answer is PaaS for the requirement described.

Question 92

Mixed final mini-mock exam | Objective 2.12 | Tricky | Scenario

A requirement says: "Use a private dedicated connection from the office to Microsoft cloud services." Which answer is best?

- A. VPN Gateway
- B. VNet peering
- C. ExpressRoute
- D. Private endpoint

Answer: C. ExpressRoute

This is correct because ExpressRoute is the best match for the scenario or definition being tested. In this objective, the key idea is private dedicated connectivity between your environment and Microsoft cloud. That aligns with objective 2.12 (Describe virtual networking: VNets, subnets, peering, Azure DNS, VPN Gateway, and ExpressRoute) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. VPN Gateway:** This is wrong because VPN Gateway refers to encrypted connectivity over the public internet between networks., whereas the best answer is ExpressRoute for the requirement described.
- B. VNet peering:** This is wrong because VNet peering refers to direct VNet-to-VNet connectivity over Microsoft backbone., whereas the best answer is ExpressRoute for the requirement described.
- D. Private endpoint:** This is wrong because Private endpoint refers to private IP endpoint in a VNet for reaching a service through Private Link., whereas the best answer is ExpressRoute for the requirement described.

Question 93

Mixed final mini-mock exam | Objective 2.16 | Tricky | Scenario

A storage design must keep copies across availability zones in the primary region and also replicate to a secondary region. Which option best fits?

- A. ZRS
- B. GRS
- C. GZRS
- D. LRS

Answer: C. GZRS

This is correct because GZRS is the best match for the scenario or definition being tested. In this objective, the key idea is geo-zone-redundant storage combining zone redundancy and geo replication. That aligns with objective 2.16 (Describe redundancy options) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. ZRS:** This is wrong because ZRS refers to zone-redundant storage with copies across availability zones in a region., whereas the best answer is GZRS for the requirement described.
- B. GRS:** This is wrong because GRS refers to geo-redundant storage with asynchronous replication to a secondary region., whereas the best answer is GZRS for the requirement described.
- D. LRS:** This is wrong because LRS refers to locally redundant storage with copies in a single location., whereas the best answer is GZRS for the requirement described.

Question 94

Mixed final mini-mock exam | Objective 2.20 | Tricky | Scenario

An old line-of-business app needs LDAP and domain join in Azure, but the company still wants Microsoft-managed services. Which identity service is the best fit?

- A. Microsoft Entra ID
- B. Microsoft Entra Domain Services
- C. Conditional Access
- D. Azure RBAC

Answer: B. Microsoft Entra Domain Services

This is correct because Microsoft Entra Domain Services is the best match for the scenario or definition being tested. In this objective, the key idea is managed domain services for LDAP, Kerberos, NTLM, and domain join scenarios. That aligns with objective 2.20 (Describe directory services in Azure: Microsoft Entra ID and Microsoft Entra Domain Services) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Microsoft Entra ID:** This is wrong because Microsoft Entra ID refers to cloud identity and access service., whereas the best answer is Microsoft Entra Domain Services for the requirement described.
- C. Conditional Access:** This is wrong because Conditional Access refers to if-then access policy engine based on signals such as user, location, or device., whereas the best answer is Microsoft Entra Domain Services for the requirement described.
- D. Azure RBAC:** This is wrong because Azure RBAC refers to role-based authorization system controlling who can do what at which scope., whereas the best answer is Microsoft Entra Domain Services for the requirement described.

Question 95

Mixed final mini-mock exam | Objective 3.06 | Tricky | Scenario

An organization needs to require a CostCenter tag on new resources and audit resources that do not comply. Which feature is the best answer?

- A. Azure RBAC
- B. Resource locks

- C. Azure Policy
- D. Azure Monitor

Answer: C. Azure Policy

This is correct because Azure Policy is the best match for the scenario or definition being tested. In this objective, the key idea is governance service that evaluates and can enforce resource standards. That aligns with objective 3.06 (Describe the purpose of Azure Policy) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Azure RBAC:** This is wrong because Azure RBAC refers to role-based authorization system controlling who can do what at which scope., whereas the best answer is Azure Policy for the requirement described.
- B. Resource locks:** This is wrong because Resource locks refers to change-protection feature that blocks deletion or modification., whereas the best answer is Azure Policy for the requirement described.
- D. Azure Monitor:** This is wrong because Azure Monitor refers to observability platform for metrics, logs, alerts, and analysis., whereas the best answer is Azure Policy for the requirement described.

Question 96

Mixed final mini-mock exam | Objective 3.03 | Tricky | Scenario

Before deploying anything, a team wants to estimate the expected monthly cost of its Azure design. Which tool is the correct answer?

- A. Cost Management
- B. Pricing Calculator
- C. Azure Advisor
- D. Log Analytics

Answer: B. Pricing Calculator

This is correct because Pricing Calculator is the best match for the scenario or definition being tested. In this objective, the key idea is tool for estimating Azure cost before deployment. That aligns with objective 3.03 (Describe cost management capabilities in Azure) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Cost Management:** This is wrong because Cost Management refers to toolset for analyzing and managing actual Azure spend after deployment., whereas the best answer is Pricing Calculator for the requirement described.
- C. Azure Advisor:** This is wrong because Azure Advisor refers to personalized recommendation service for best practices and optimization., whereas the best answer is Pricing Calculator for the requirement described.
- D. Log Analytics:** This is wrong because Log Analytics refers to Azure Monitor log query and investigation experience/workspace., whereas the best answer is Pricing Calculator for the requirement described.

Question 97

Mixed final mini-mock exam | Objective 2.08 | Tricky | Scenario

A processing component should run only when new messages arrive and should incur compute charges only while it executes. Which option is best?

- A. Virtual machines
- B. Azure Functions

- C. Availability sets
- D. Azure Files

Answer: B. Azure Functions

This is correct because Azure Functions is the best match for the scenario or definition being tested. In this objective, the key idea is serverless event-driven compute service. That aligns with objective 2.08 (Compare compute types: containers, virtual machines, and functions) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Virtual machines:** This is wrong because Virtual machines refers to customizable compute instances where you manage the guest OS., whereas the best answer is Azure Functions for the requirement described.
- C. Availability sets:** This is wrong because Availability sets refers to VM placement feature that improves resilience against host/update-domain issues., whereas the best answer is Azure Functions for the requirement described.
- D. Azure Files:** This is wrong because Azure Files refers to managed file shares over SMB or NFS., whereas the best answer is Azure Functions for the requirement described.

Question 98

Mixed final mini-mock exam | Objective 2.24 | Tricky | Scenario

A user must be allowed to start and stop VMs in one resource group but not in other resource groups. Which Azure concept is central to the solution?

- A. Azure Service Health
- B. Azure RBAC
- C. Blob Storage
- D. Region pairs

Answer: B. Azure RBAC

This is correct because Azure RBAC is the best match for the scenario or definition being tested. In this objective, the key idea is role-based authorization system controlling who can do what at which scope. That aligns with objective 2.24 (Describe Azure role-based access control (RBAC)) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Azure Service Health:** This is wrong because Azure Service Health refers to personalized view of Azure incidents, maintenance, and advisories that affect you., whereas the best answer is Azure RBAC for the requirement described.
- C. Blob Storage:** This is wrong because Blob Storage refers to object storage for large amounts of unstructured data., whereas the best answer is Azure RBAC for the requirement described.
- D. Region pairs:** This option does not best match the definition or requirement in the question. The strongest answer is Azure RBAC.

Question 99

Mixed final mini-mock exam | Objective 3.15 | Tricky | Scenario

A team wants a single Azure platform for metrics, logs, and alerts, with app-level tracing where needed. Which service is the umbrella answer?

- A. Azure Monitor
- B. Application Insights
- C. Azure Advisor
- D. Microsoft Purview

Answer: A. Azure Monitor

This is correct because Azure Monitor is the best match for the scenario or definition being tested. In this objective, the key idea is observability platform for metrics, logs, alerts, and analysis. That aligns with objective 3.15 (Describe Azure Monitor, including Log Analytics, Azure Monitor alerts, and Application Insights) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- B. Application Insights:** This is wrong because Application Insights refers to application performance monitoring for apps and services., whereas the best answer is Azure Monitor for the requirement described.
- C. Azure Advisor:** This is wrong because Azure Advisor refers to personalized recommendation service for best practices and optimization., whereas the best answer is Azure Monitor for the requirement described.
- D. Microsoft Purview:** This is wrong because Microsoft Purview refers to Microsoft portfolio for data governance, data security, and data compliance., whereas the best answer is Azure Monitor for the requirement described.

Question 100

Mixed final mini-mock exam | Objective 2.13 | Tricky | Scenario

A security team says an Azure PaaS service must be reachable only through a private IP in the VNet. Which answer is best?

- A. Public endpoint
- B. Private endpoint
- C. VPN Gateway
- D. Availability zone

Answer: B. Private endpoint

This is correct because Private endpoint is the best match for the scenario or definition being tested. In this objective, the key idea is private IP endpoint in a VNet for reaching a service through Private Link. That aligns with objective 2.13 (Define public and private endpoints) and the guide section that explains the distinction and common exam trap.

Why the other options are wrong:

- A. Public endpoint:** This is wrong because Public endpoint refers to internet-reachable service endpoint., whereas the best answer is Private endpoint for the requirement described.
- C. VPN Gateway:** This is wrong because VPN Gateway refers to encrypted connectivity over the public internet between networks., whereas the best answer is Private endpoint for the requirement described.
- D. Availability zone:** This is wrong because Availability zone refers to physically separate location inside a region with independent infrastructure., whereas the best answer is Private endpoint for the requirement described.
