

HTTP STATUS CODES –

DEVOPS DEBUGGING GUIDE –

Guide for Azure Cloud + DevOps + Developer Troubleshooting

1XX INFORMATIONAL

100 Continue
101 Switching

API
Gateway

Low-level signals

• API Gateway • Reverse Proxy

◆ **Don't trust 2xx blindly!**

Correlate 200 codes with
backend success

2XX SUCCESS

200 OK
201 Created

• Could still have
partial server-side failures

◆ **Azure Application Insights**

3XX REDIRECTION

301/302
307/308
304 Not Modified

• Infinite redirect loops
• HTTPS enforcement issues
• **CDN / Azure Applt Gateway**

4XX CLIENT ERRORS

400 Bad Request
401 Unauthorized
403 Forbidden

• Frequent debugging:
• Schema mismatch
• Auth failures
• RBAC, wrong route/service

5XX SERVER ERRORS

500 Internal Error
502 Bad Gateway
503 Unavailable

• Map if in app or infra?
• App crash / **proxy failure**
• Gateway / Auth / Service
• PD / Backend API / **DB**

DEBUGGING FLOW

1

Identify
Status Code

Find Where
it Originated

CDN ~ Gateway →
App/Pod ~ Backend

Correlate with
Logs + Metrics

Validate
Routing / Auth / Health

REAL-WORLD DEVOPS PERSPECTIVE

- Log context + correlation IDs, not just status codes
- **5xx spikes mean infra** issue, not single response
- Separate **platform** vs app failures

Which layer is failing?

REAL-WORLD DEVOPS PERSPECTIVE

- Log context + correlation IDs, not just status codes
- 5xx spikes mean infra issue, not single response failure
- Separate platform vs app failures
